Mr. Mark Rose  
Archaeology Magazine

Dear Mr. Rose,

In response to your question regarding the “pyramid” in Bosnia, here is my answer:

The discoverer of the “pyramid” in Bosnia, Semir Osmanagic, who claims that a hill near the Bosnia River is a man-made structure built before the end of the last Ice Age, is not a specialist on pyramids. His previous claim that the Maya are from the Pleiades and Atlantis should be enough for any educated reader.

This “pyramid” is actually a sloping hill near a village. This was famous in the Middle Ages as a meeting place for merchants. What was found there is really just a mass of huge stones, evidently a natural geologic formation. The stones do not match, and there is no evidence that they were put together to form a solid structure. No one can say that these stones were transported by human beings since each weighs approximately 40 tons. Apart from its general outline, this hill bears absolutely no resemblance to the Egyptian pyramids. Mr. Barakat, the Egyptian geologist working with Mr. Osmanagic, knows nothing about Egyptian pyramids. He was not sent by the SCA, and we do not support or concur with his statements.

Other archaeologists, such as a specialist in Prehistory at the National Museum in Sarajevo named Zellika, have stated that Mr. Osmanagic is giving out false information. What can Mr. Osmanagic use to show the age of the “pyramid?” No archaeological materials have been found near the pyramid. Mr. Osmanagic’s theories are purely hallucinations on his part, with no scientific backing.

Sincerely yours,

Dr. Zahi Hawass  
Secretary General, SCA
